

Scrum is a process framework for managing product and other knowledge development. Scrum is empirical in that it allows teams to hypothesize how something works, to test it, to reflect on the experience and to make the right adjustments. That is, if the frame is used correctly. Scrum is organized to enable teams to adopt practices from different frameworks in the context of the team.

The roles in Scrum are quite different from the traditional software methods. Clearly defined roles and expectations help individuals perform their tasks efficiently. In Scrum, there are three roles: Product Owner, Development Team, and Scrum Master. Together these are known as the Scrum Team.

Following are the roles in scrum with their roles and responsibilities are mention below:

1. The scrum masters

Scrum Master is the person who facilitates/coaches the Development Team and the Product Owner to work in everyday job. He is responsible for ensuring the team knows and practices the Scrum values and principles. Scrum Master also ensures that the team is excited about Agile to gain the best out of the frame. Scrum Master also encourages and assists the team in organizing themselves. In addition to instructing the members of the team about the importance of Agile, he is also responsible for ensuring that the team always feels motivated and strengthens. He also attempts to enhance communication and cooperation between the team members.

2. The product owner

The Product Owner is another critical role. As the voice of the customer/stakeholders, the Product Owner is responsible for bridging the gap between the development team and stakeholders. The product owner manages the gap in such a way that the value of the product being built is maximized. The Product Owner is expected to be involved in all Sprint Activities and Development efforts and plays a critical role in the success of a product.

A Product Owner oversees the Product backlog and is responsible for writing user stories and acceptance criteria. A Product Owner oversees prioritizing the Product Backlog and deciding on the release date and content. A Product Owner decides whether to accept or reject a product backlog item.

3. Development team

The Development Team is an essential component of the Scrum Team. The Development Team is made up of developers who are experts in their respective fields. The Development Team, unlike the other Scrum Team members, works on the actual implementation of the potentially deliverable software/increment that is to be delivered at the end of each Sprint. The Development Team may include people with specialized skills such as Front-end Developers, Backend Developers, Dev-Ops, QA Experts, Business Analyst, DBA, and so on, but they are all referred to as Developers; no other titles are permitted. The Development Team cannot even have sub-teams such as the testing team, the requirement specification team, and so on.

The Team is formed with all the necessary skill sets in mind to successfully develop, test, and deliver product increments every Sprint without the assistance of others. As a result, the team must be self-sufficient and cross-functional. The Development Team does not seek assistance from anyone outside of the Scrum Team and manages their own work.
